

Fixed Agreement Plan API

A paid, deterministic planning service for agents preparing a policy-bound fixed USDC agreement on Arc Testnet.

\$

\$0.01 per request

Service fee settled through Circle Gateway x402.

402

x402 v2 exact

Valid unpaid requests receive HTTP 402 and PAYMENT-REQUIRED.

P

Planning only

No escrow creation, funding, release or payer credential exposure.

POST ENDPOINT

<https://hashpaystream.app/api/hashpaystream/v1/circle-marketplace/agreement-plan>

Two amounts, two separate actions

The \$0.01 USDC x402 payment buys the API response. The proposed agreement amount in the request remains unfunded and requires a later wallet-authorized action through an approved HashPayStream pilot integration.

What the service returns

A stable plan id, normalized fixed-release terms, Arc Testnet funding requirements, lifecycle safeguards, verified service-payment metadata, and the next authorized action. The payer address is intentionally omitted.

REQUEST AND PAYMENT FLOW

Validate first. Pay second.

HashPayStream validates the complete JSON body before presenting any payment requirement. Malformed input receives HTTP 400 without a PAYMENT-REQUIRED challenge.

Request body

```
{
  "template": "fixed_unlock",
  "title": "Verified research delivery",
  "description": "Deliver a cited research brief for payer review.",
  "amount": "0.10",
  "recipient": "0x1111111111111111111111111111111111111111",
  "durationSeconds": 86400,
  "cancellationWindowSeconds": 900
}
```

FIELD	REQUIREMENT
<code>template</code>	Optional; defaults to and currently accepts only fixed_unlock .
<code>title</code>	3 to 120 characters after whitespace normalization.
<code>description</code>	10 to 2,000 characters after whitespace normalization.
<code>amount</code>	Positive USDC decimal string with at most six decimal places.
<code>recipient</code>	Valid, non-zero EVM address.
<code>durationSeconds</code>	Whole number from 3,600 through 31,536,000.
<code>cancellationWindowSeconds</code>	Whole number from zero to less than the duration.

- 01 Submit**
Send the complete application/json request.
- 02 Challenge**
A valid unpaid request receives HTTP 402 with Circle Gateway's x402 v2 payment requirements for Arc Testnet.
- 03 Settle**
A compatible x402 client authorizes and settles exactly \$0.01 USDC.
- 04 Receive plan**
The paid request returns HTTP 200 with the deterministic plan and verified payment metadata.

RESPONSE AND OPERATIONAL BOUNDARY

Machine-readable and deliberately bounded.

HTTP behavior

200 - Plan returned

Payment is verified. The response includes plan, safeguards, payment metadata and nextAction.

400 - Invalid input

Validation fails before any x402 payment challenge is presented.

402 - Payment required

Valid request. PAYMENT-REQUIRED contains the Circle Gateway challenge.

503 - Temporarily unavailable

Marketplace payment configuration or Circle payment processing is unavailable.

Success response shape

```
{
  "ok": true,
  "service": "hashpaystream-fixed-agreement-plan",
  "plan": {
    "id": "hpp...",
    "template": "fixed_unlock",
    "asset": "USDC",
    "agreementNetwork": "eip155:5042002",
    "fundingRequired": "0.10 USDC",
    "marketplacePaymentFundsEscrow": false,
    "safeguards": ["..."]
  },
  "payment": {
    "verified": true,
    "amountAtomic": "10000",
    "network": "eip155:5042002"
  },
  "nextAction": "Use an approved HashPayStream pilot integration to create and fund this agreement."
}
```

Security and custody boundary

The endpoint does not accept or return private keys, recovery phrases, Circle sessions, bearer credentials, or payer addresses. All API responses use Cache-Control: no-store. Agreement creation and escrow funding are separate, wallet-authorized pilot actions.
